

Operations Guide

Installation

Follow this ordered checklist before opening the service:

1. Confirm the package checksum matches the approved release record.
2. Install the package in the designated private application network.
3. Record the immutable revision and the operator identity in the log.

The checklist preserves a clear audit trail for every installation.

Verification

Complete these checks before publishing prepared content:

- Run the readiness probe and confirm every required provider is ready.
- Verify the document page count and the canonical Markdown hash.
- Compare the expected point count with the active vector collection.

Stop publication immediately if any recorded value differs.
